

# General linear model and classical inference

SPM for M/EEG  
May 2019

Martin Dietz  
CFIN, Aarhus University, DK

# Overview

## **Introduction**

- Statistical parametric maps of MEG/EEG data
- ERP example

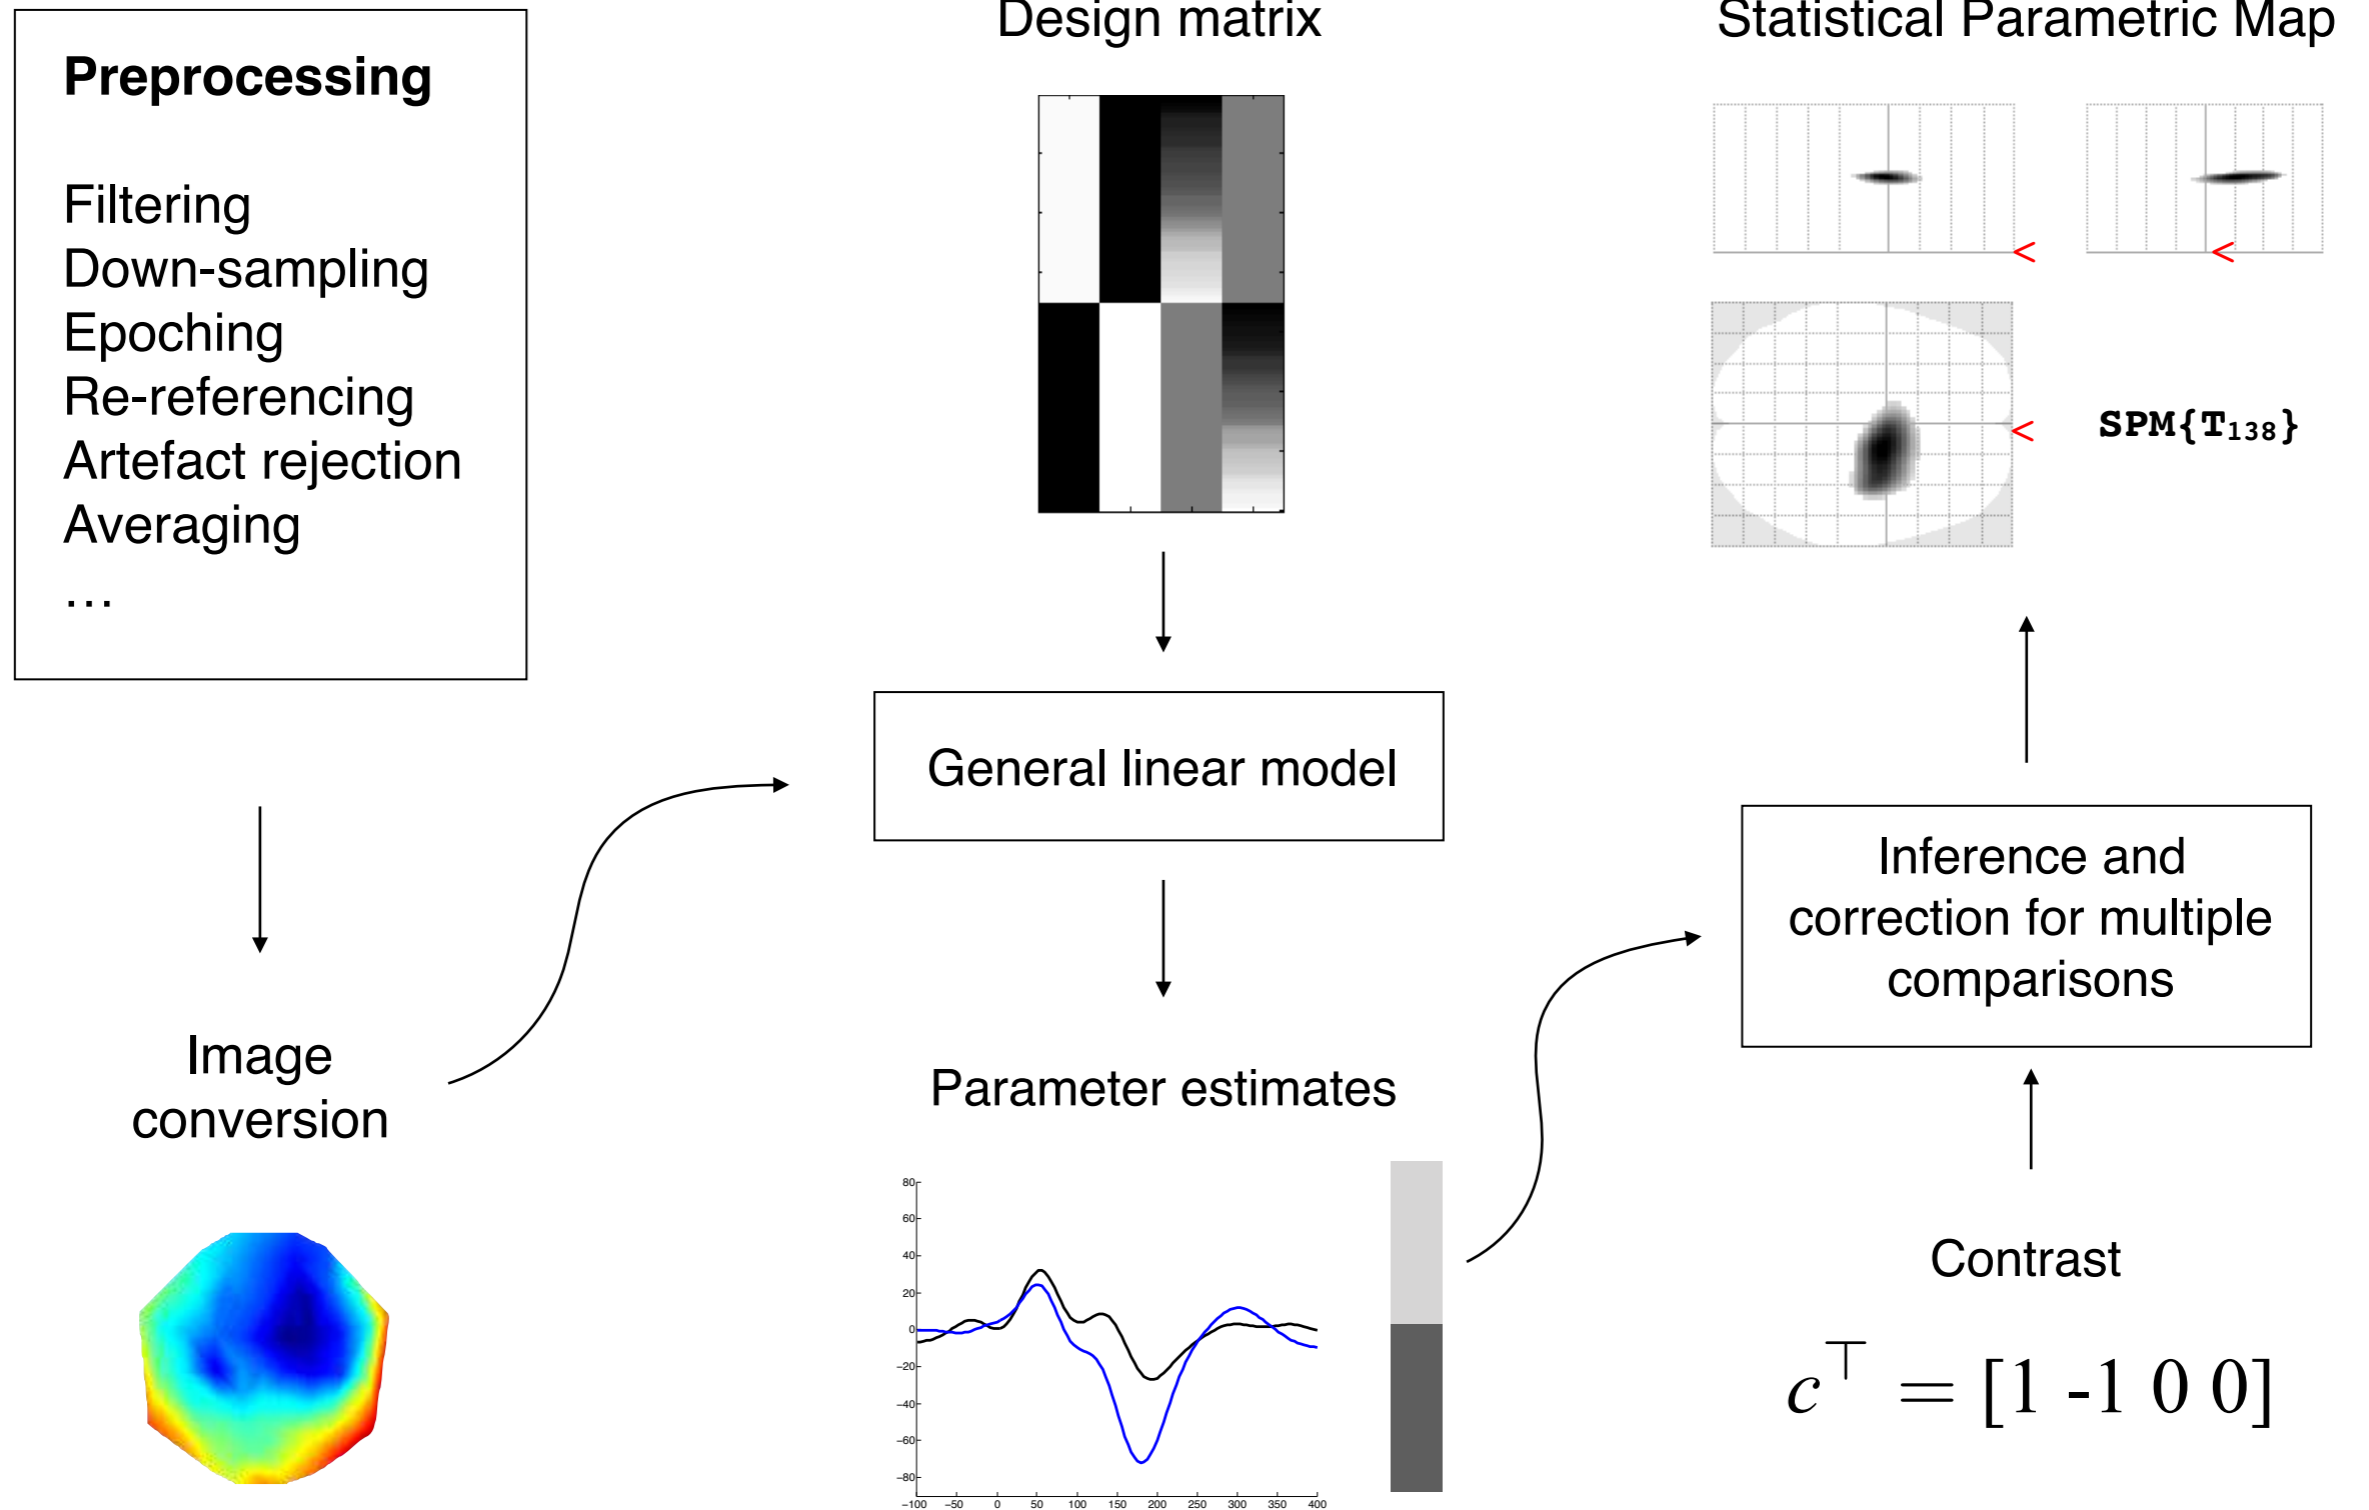

## **General linear model (GLM)**

- Definition & design matrix
- Parameter estimation

## **Classical inference**

- Contrasts and inference
- Correlated regressors

# Overview of SPM for M/EEG

## Preprocessing

- Filtering
- Down-sampling
- Epoching
- Re-referencing
- Artefact rejection
- Averaging
- ...

Image conversion

Design matrix

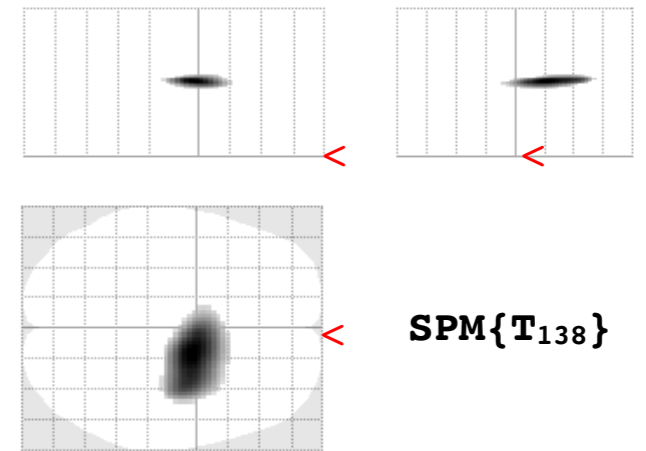

General linear model

Parameter estimates

Statistical Parametric Map

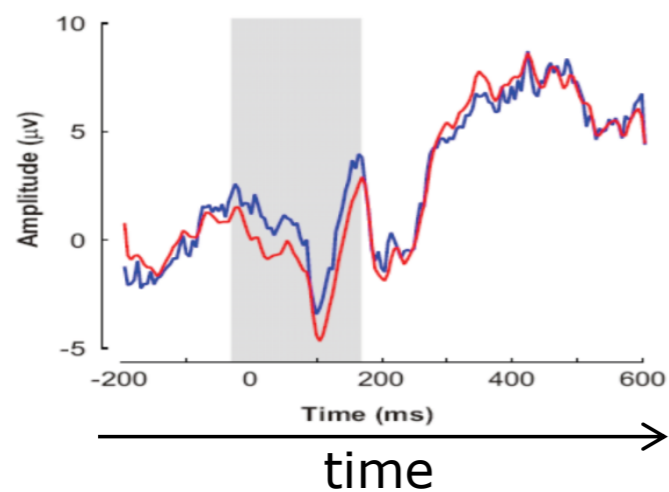

Inference and correction for multiple comparisons

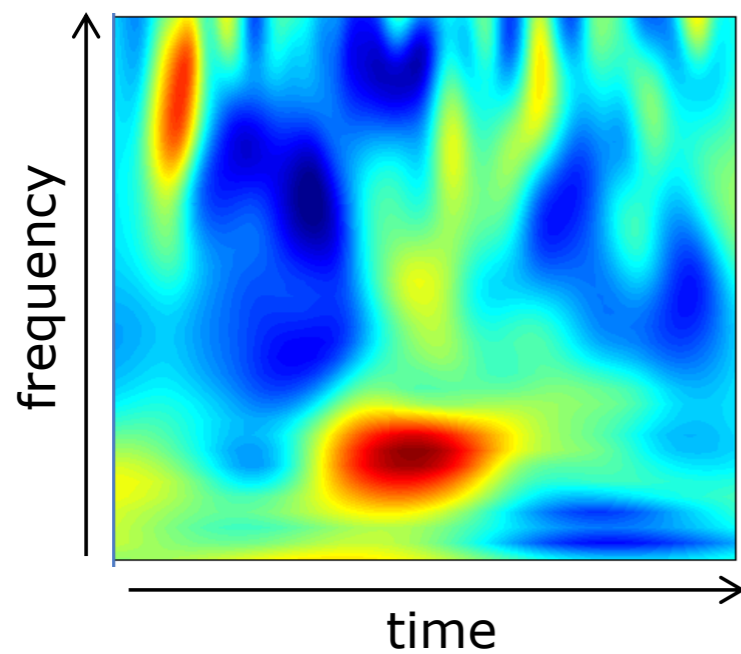

Contrast

$$c^T = [1 \ -1 \ 0 \ 0]$$

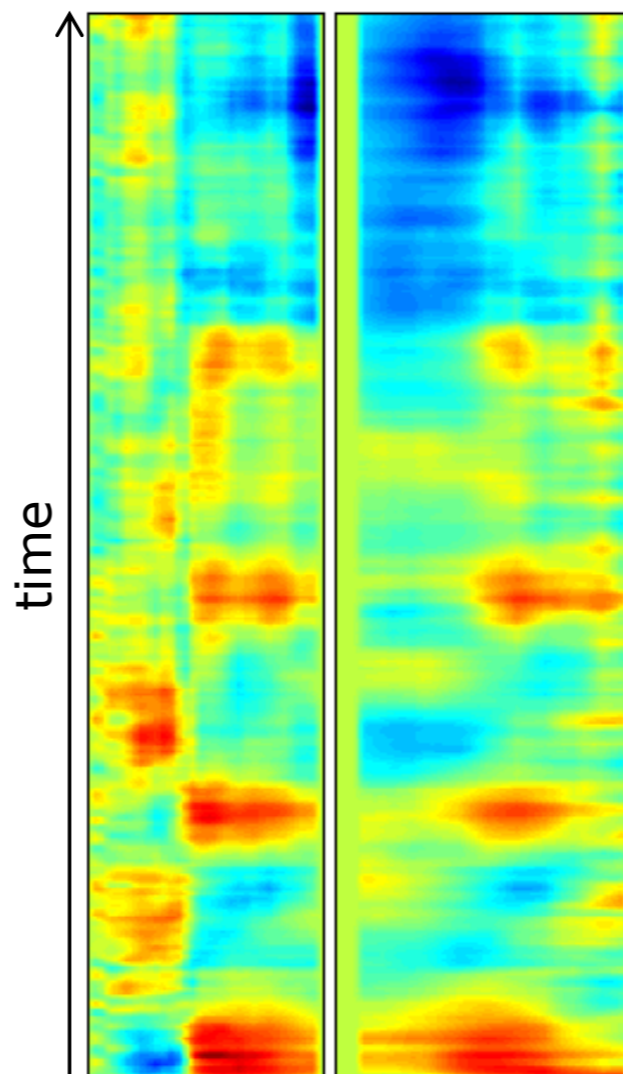

# Statistical parametric maps

1D time

2D time-frequency

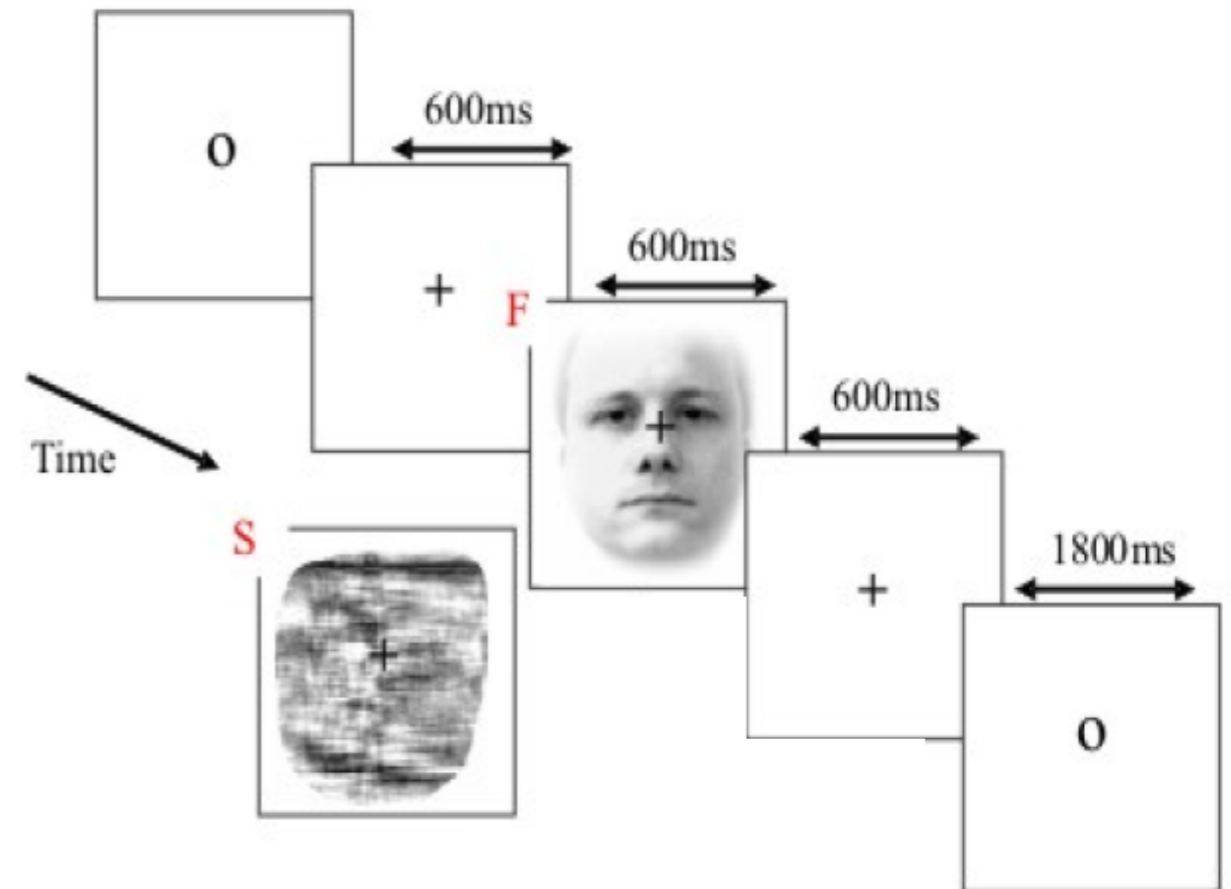

2D+t  
scalp-time

3D M/EEG source  
reconstruction

# Event-related potential (ERP) example

- Random presentation of '*faces*' and '*scrambled faces*'
- 70 trials of each type
- 128 EEG channels

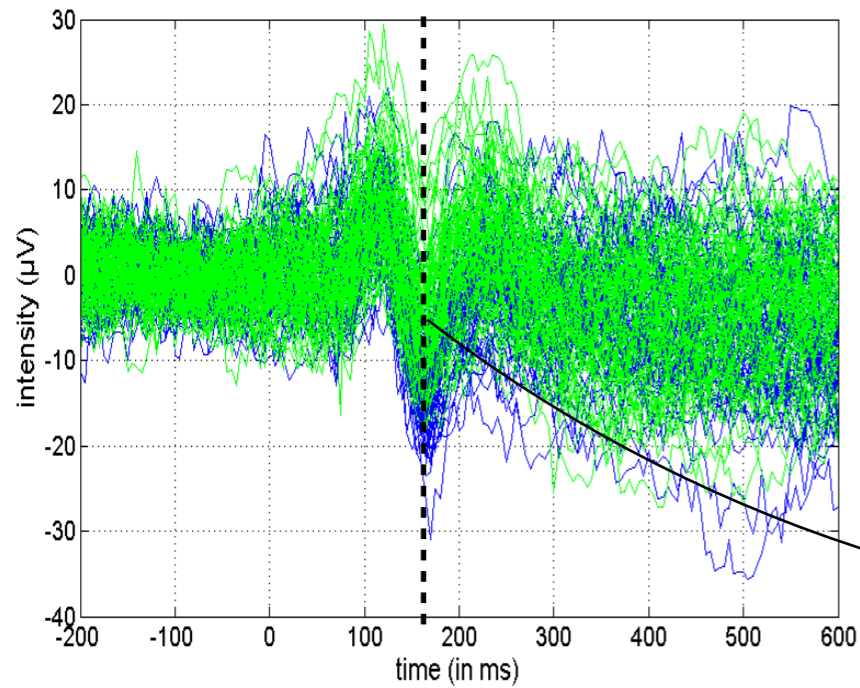

*Question:*

Is there a difference between the ERP of '*faces*' and '*scrambled faces*' ?

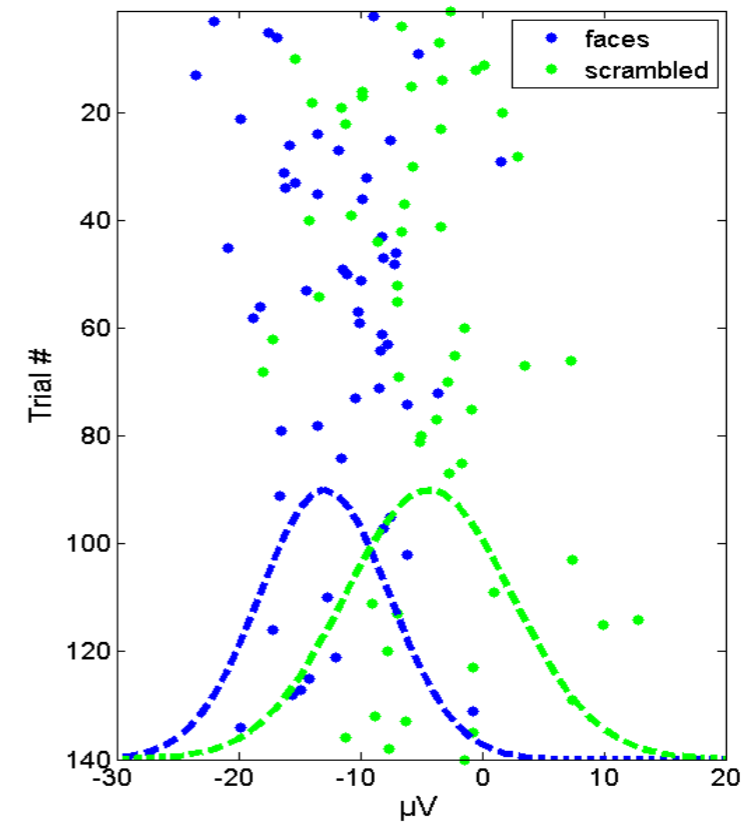

# ERP example: ones channel

Trial-by-trial variability

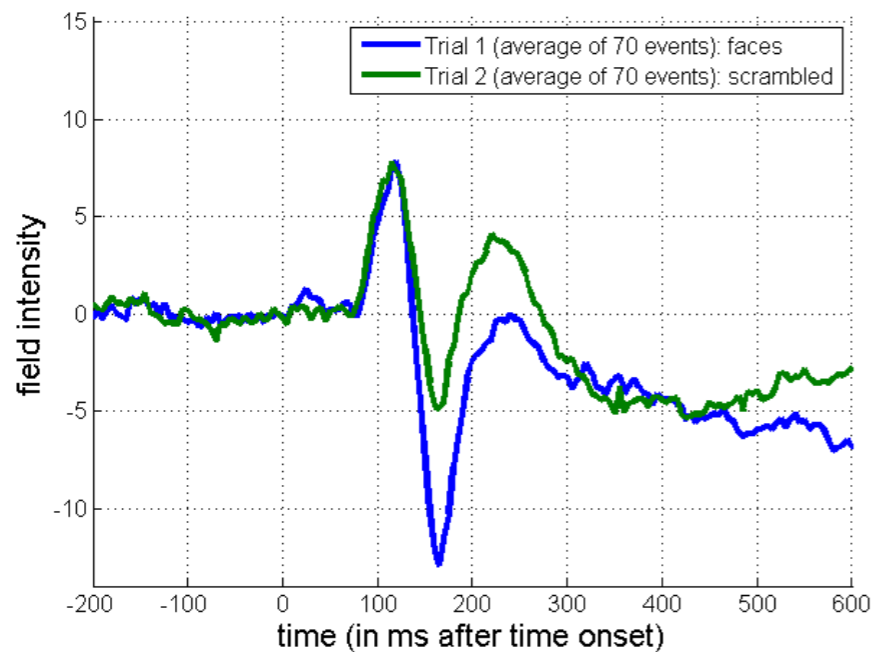

Compare size of effect  
to its standard error

(*Signal-to-noise ratio*)

Average

$$t = \frac{\mu_f - \mu_s}{\sqrt{\hat{\sigma}^2 \left( \frac{1}{n_f} + \frac{1}{n_s} \right)}}$$

# Overview

## Introduction

- Statistical parametric maps of MEG/EEG data
- ERP example

## **General linear model (GLM)**

- Definition & design matrix
- Parameter estimation

## Classical inference

- Contrasts and inference
- Correlated regressors

# Data modelling

EEG data

=

'Faces'

+

'Scrambled'

+

Residual error

$Y$

=

$x_1\beta_1$

+

$x_2\beta_2$

+

$\epsilon$

# General linear model

Data                      Design matrix                      Parameters                      Error

$$Y = X \cdot \beta + \epsilon$$

# General linear model

GLM defined by

$$Y = X\beta + \epsilon$$

$$\epsilon \sim \mathcal{N}(\mathbf{0}, \sigma^2 I)$$

The design matrix  $X$  embodies all knowledge about  
*experimentally controlled factors and confounds*

# General linear model

Linear regression

$$y = x_0\beta_0 + x_1\beta_1 + \dots + x_p\beta_p + \epsilon$$

Matrix form

$$Y = X\beta + \epsilon$$

$$\begin{bmatrix} y_1 \\ \vdots \\ y_n \\ \vdots \\ y_N \end{bmatrix} = \begin{bmatrix} x_{11} & \dots & x_{1p} & \dots & x_{1P} \\ \vdots & \ddots & \vdots & \ddots & \vdots \\ x_{n1} & \dots & x_{np} & \dots & x_{nP} \\ \vdots & \ddots & \vdots & \ddots & \vdots \\ x_{N1} & \dots & x_{Np} & \dots & x_{NP} \end{bmatrix} \begin{bmatrix} \beta_1 \\ \vdots \\ \beta_p \\ \vdots \\ \beta_P \end{bmatrix} + \begin{bmatrix} \epsilon_1 \\ \vdots \\ \epsilon_n \\ \vdots \\ \epsilon_N \end{bmatrix}$$

# General linear model

## Special cases of the GLM

- $t$ -test
- $F$ -test
- Analysis of variance (ANOVA)
- Analysis of covariance (AnCova)
- multiple regression

$$Y = X\beta + \epsilon$$

# Voxel-wise general linear model

2D or 3D image

2D pixel, 3D space-time  
or 3D voxel

$Y$

$X$

$\beta$

$\epsilon$

=

+

# Parameter estimation

Iff residual error is i.i.d.

$$\epsilon = y - X\hat{\beta}$$

$$\epsilon \sim \mathcal{N}(0, \sigma^2 I)$$

Ordinary least squares

minimise  $\sum_i \hat{\epsilon}_i^2$  w.r.t  $\hat{\beta}$

$$\hat{\beta} = (X^\top X)^{-1} X^\top y$$

# Parameter estimation: a geometric perspective

Ordinary least squares

$$\hat{\beta} = (X^T X)^{-1} X^T y$$

Residual forming matrix

$$\epsilon = Ry$$

$$R = I - P$$

Projection matrix

$$\hat{y} = Py$$

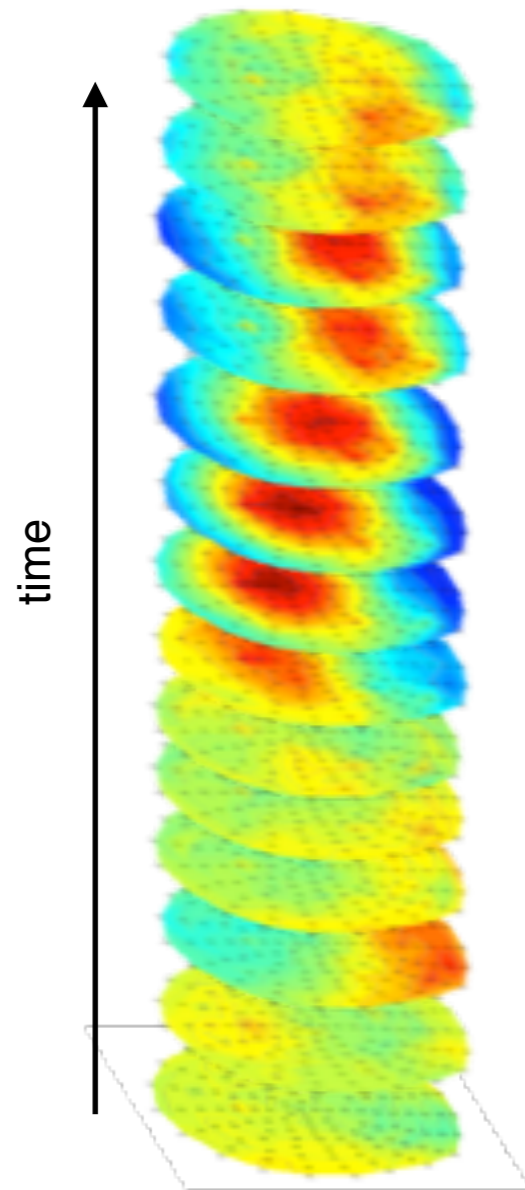

$$P = X(X^T X)^{-1} X^T$$

Design space of  $X$

# Channels to voxels transformation

M/EEG channels

Spatio-temporal  
interpolation

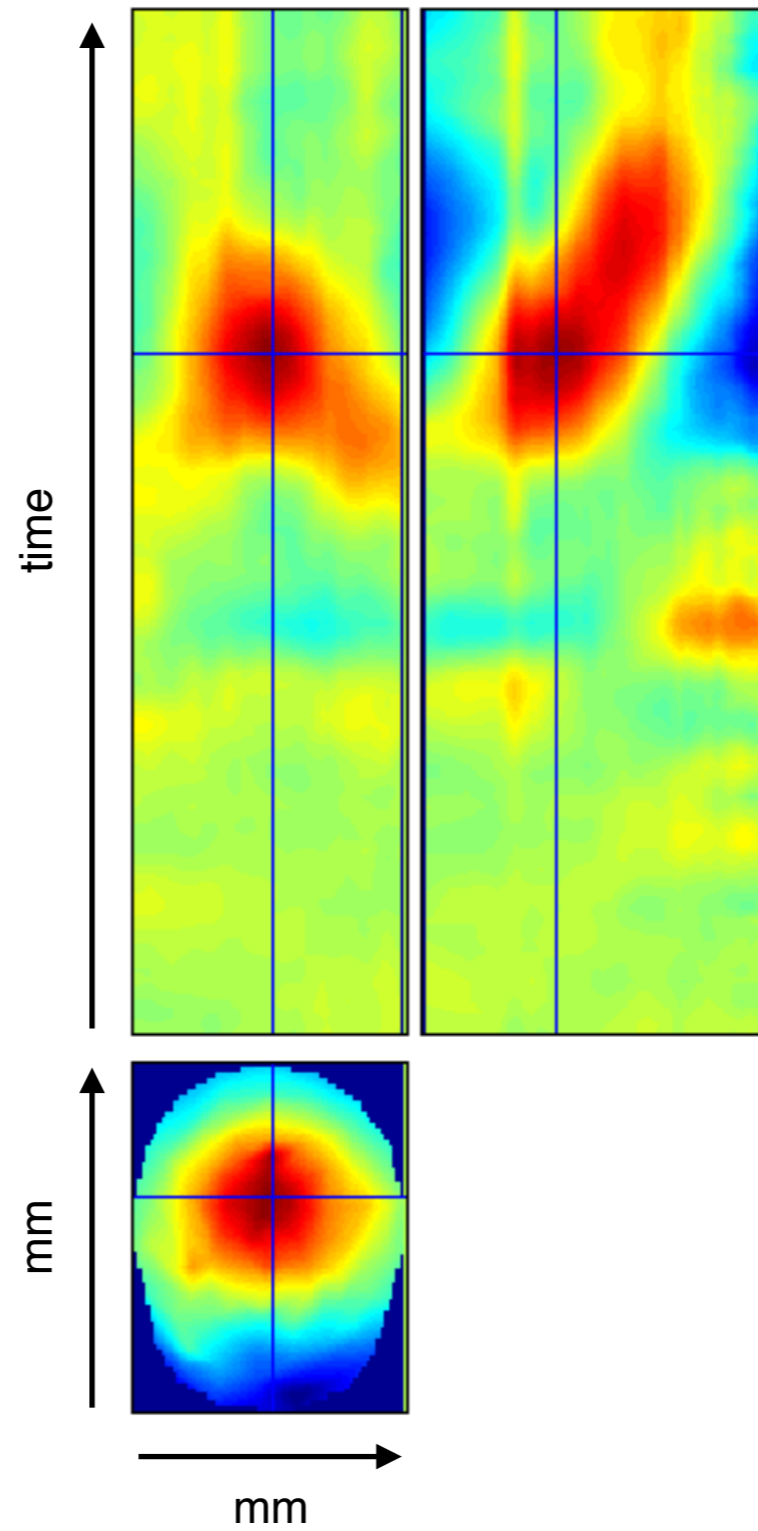

3D image (Nifti)

# Mass-univariate statistical framework

# Mass-univariate statistical framework

*Avoid selection bias (“cherry picking”)*

# Overview

## Introduction

- Statistical parametric maps of MEG/EEG data
- ERP example

## General linear model (GLM)

- Definition & design matrix
- Parameter estimation

## **Classical inference**

- Contrasts and inference
- Correlated regressors

# Hypothesis testing in classical inference

## The null hypothesis $H_0$

No effect under null distribution

## Alternative hypothesis $H_A$

*Unlikely or surprising* effect  
under null distributions

# Contrast and t-test

Contrast vector

$$c^T = [1 \quad -1]$$

Linear combination  
of parameters

$$\hat{\beta}_1 > \hat{\beta}_2$$

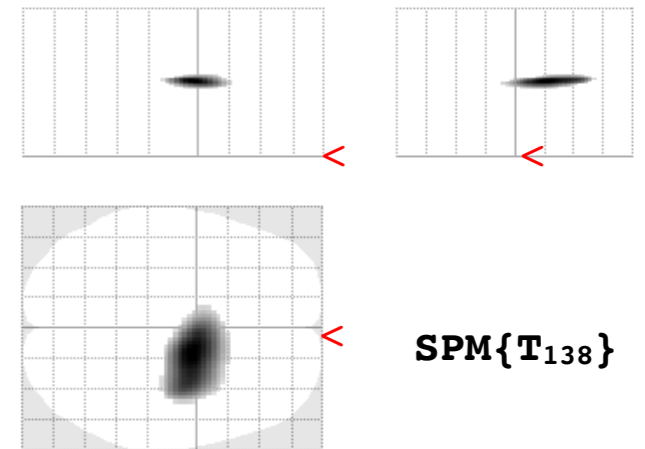

$$(1 \times \hat{\beta}_1) + (-1 \times \hat{\beta}_2) > 0$$

$$c^T \hat{\beta} > 0$$

*t*-contrast

$$t = \frac{c^T \hat{\beta}}{\sqrt{\sigma^2 (c^T (X^T X)^{-1} c)}}$$

SPM-*t* over time-space

# Classical inference

Constrast

$$c = [1 \ -1]^\top$$

$t$  statistic

$$t = \frac{c^\top \hat{\beta}}{\sqrt{\sigma^2 (c^\top (X^\top X)^{-1} c)}}$$

$p$  value

$$p(T \geq t | H_0)$$

Analytic  $T$  null distribution

# Classical inference

False-positive rate

$$\alpha = p(T \geq u_\alpha | H_0)$$

High threshold

$$u_\alpha = T \propto \alpha$$

$$\alpha = 0.05$$

Analytic  $T$  null distribution

# *t*-test summary

## Contrast

Linear combination of parameters

## *t*-test

Signal-to-noise ratio measure

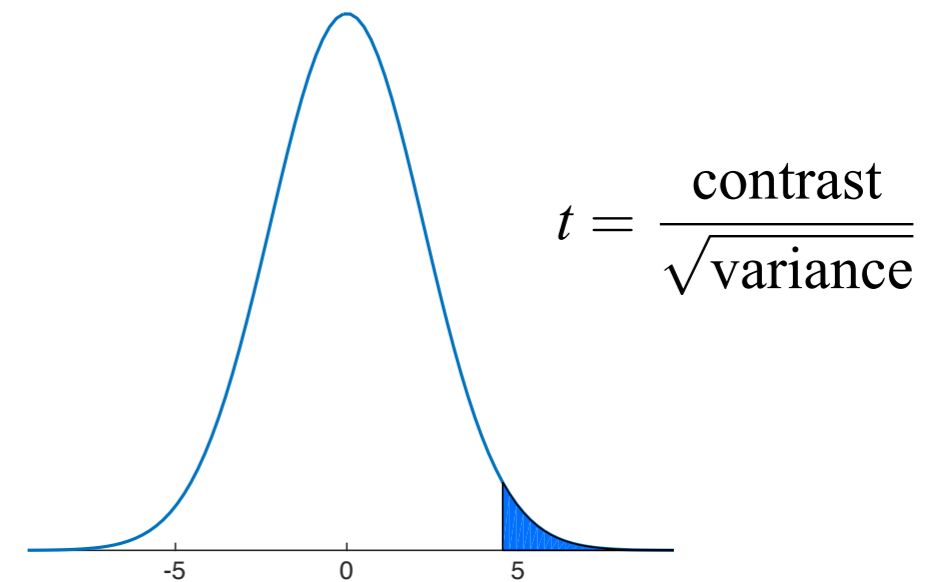

## *t*-statistic

No dependence on  
scaling of regressors or contrast

## Unilateral test

$$\mathbf{H}_0: c^\top \hat{\beta} = 0$$

$$\mathbf{H}_A: c^\top \hat{\beta} > 0$$

# F-test and extra sum-of-squares

Full model

Reduced model

**F-statistic**

$X_0$   $X_1$

$X_0$

$$\text{RSS} \\ \sum \hat{\varepsilon}_{full}^2$$

$$\text{RSS}_0 \\ \sum \hat{\varepsilon}_{reduced}^2$$

*Ratio of explained and unexplained variance*

$$F \propto \frac{\text{RSS}_0 - \text{RSS}}{\text{RSS}}$$

$$F \propto \frac{\text{ESS}}{\text{RSS}} \sim F_{v_1, v_2}$$

$$v_1 = \text{rank}(X) - \text{rank}(X_0) \\ v_2 = N - \text{rank}(X)$$

# F-test and multi-dimensional contrasts

$$H_0: \beta_3 = \beta_3 = 0$$

$$H_A: c^T \hat{\beta} > 0$$

$$c^T = \begin{matrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{matrix}$$

SPM( $F_{2,136}$ )

# F-test summary

## F-test

Additional variance explained by full model  
w.r.t. a reduced (nested) model

$$F \propto \frac{RSS_0 - RSS}{RSS}$$

## Uni-dimensional contrast

Testing  $b_1 - b_2$  is the same as testing  $b_2 - b_1$   
It is exactly the square of the  $t$ -test, testing for both  
positive and negative effects

$$F \propto \frac{ESS}{RSS} \sim F_{v_1, v_2}$$

## Multi-dimensional contrast

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$H_0 : \beta_1 = \beta_2 = \beta_3 = 0$$

$$H_A : \text{at least one } \beta_k \neq 0$$

# Correlated and orthogonal regressors

$$y = x_1\beta_1 + x_2\beta_2 + e$$
$$\beta_1 = \beta_2 = 1$$

$$y = x_1\beta_1 + x_2^*\beta_2^* + e$$
$$\beta_1 > 1; \beta_2^* = 1$$

## Correlated regressors

Explained variance shared  
between regressors

## Orthogonalised regressors

Parameter estimate for  $x_1$   
changes, not for  $x_2$

# Orthogonal regressors

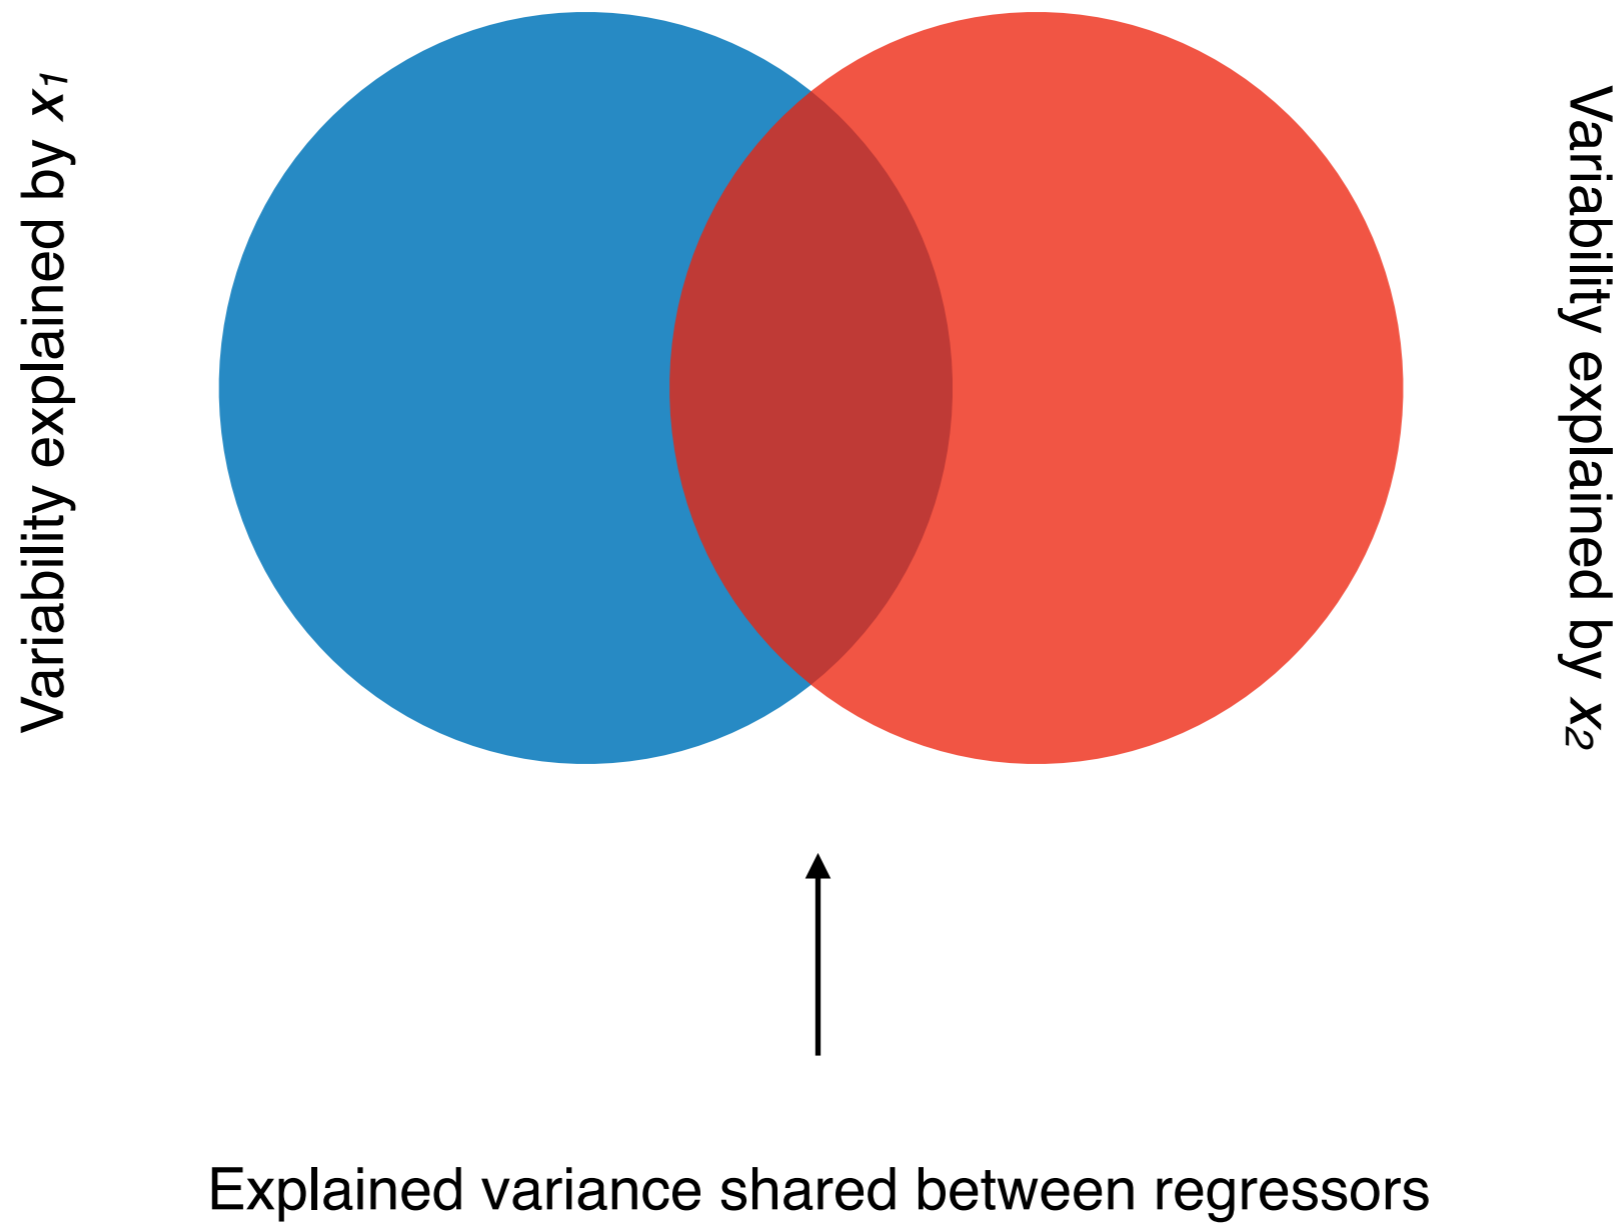

Variability explained by  $x_1$

Variability explained by  $x_2$

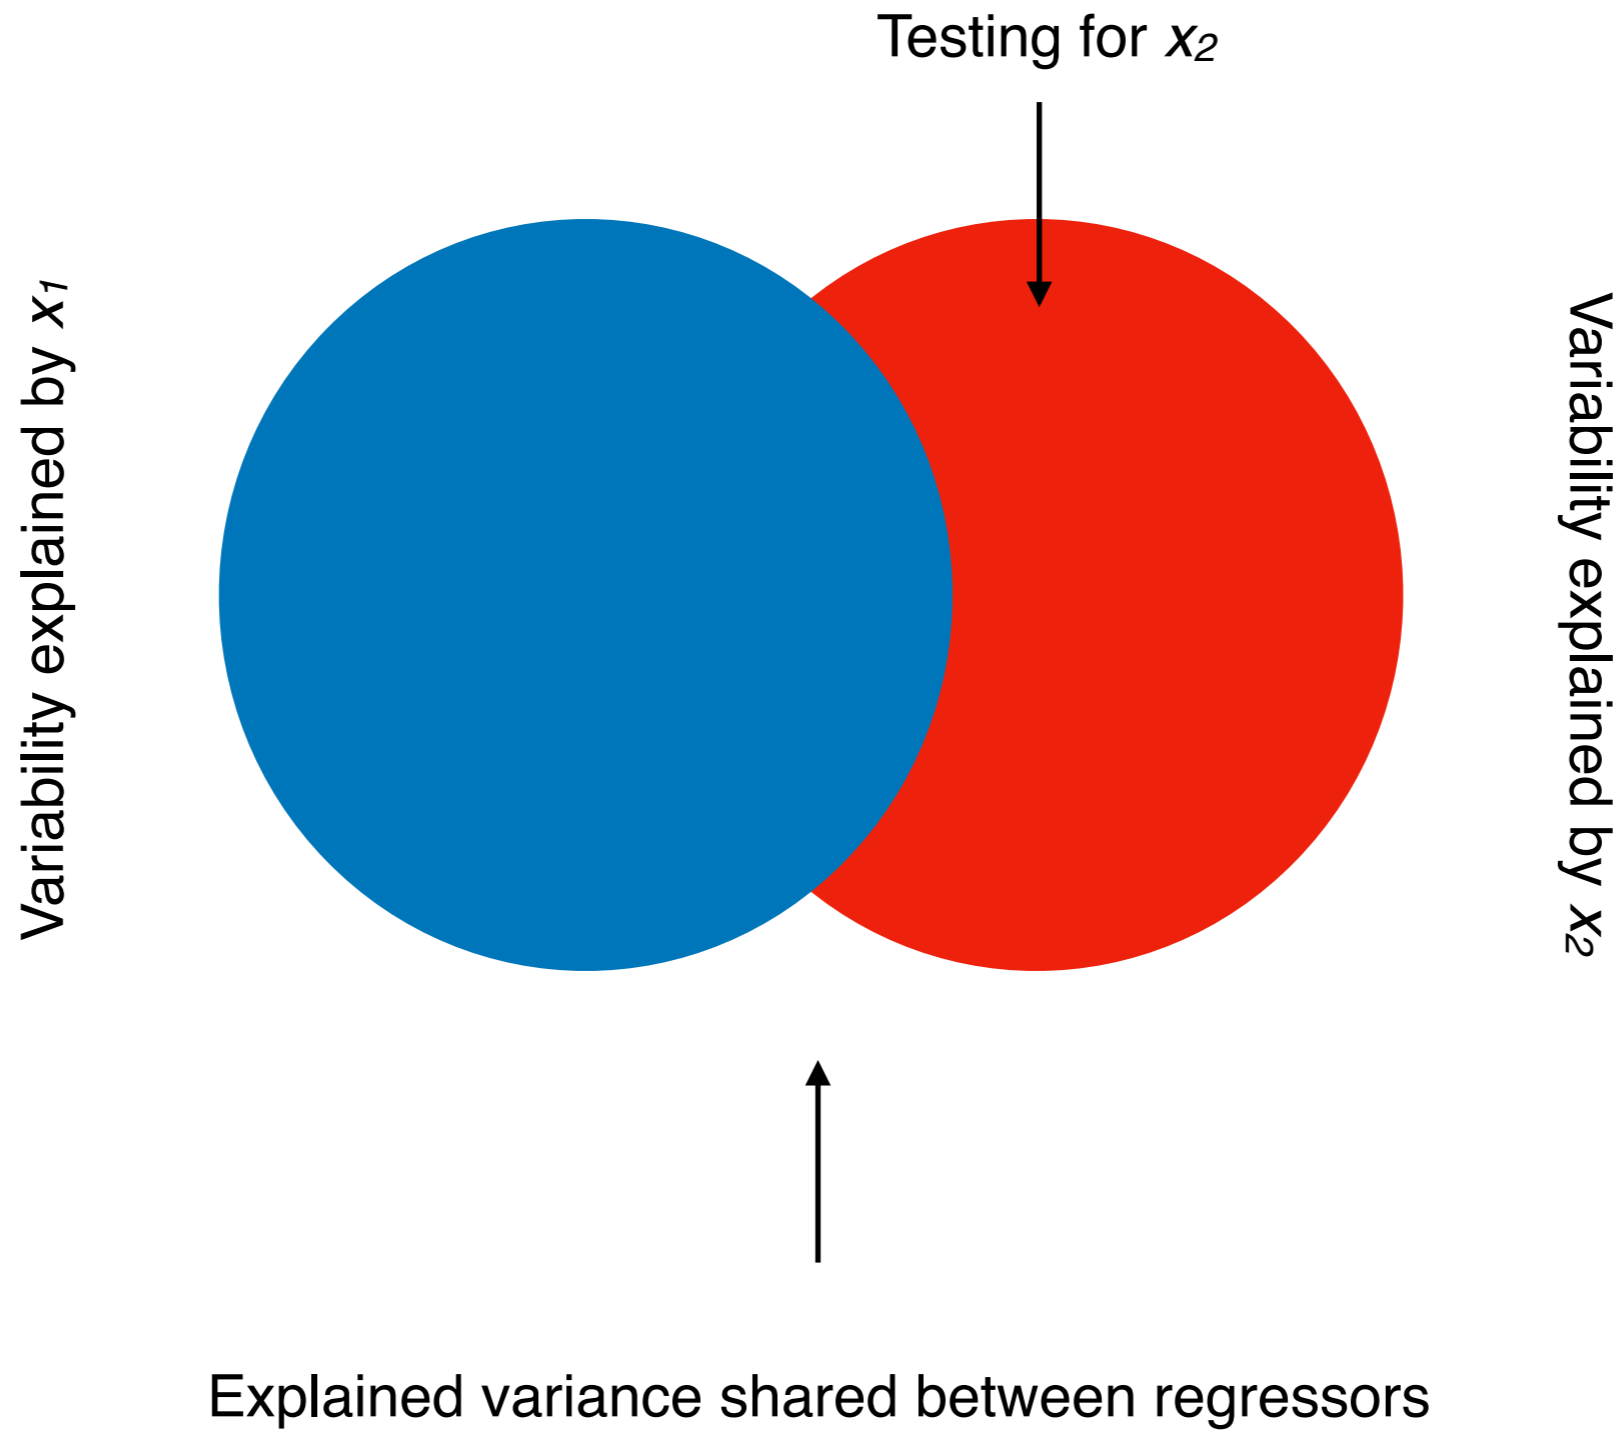

# Correlated regressors

# Correlated regressors

# Correlated regressors

# Summary

## *Special cases of the GLM*

- *t*-test
- *F*-test
- Analysis of variance (ANOVA)
- Analysis of covariance (AnCova)
- multiple regression

$$Y = X\beta + \epsilon$$

Thank you!

Any questions ?

Thanks to Christophe, Guillaume, Will, Rik, Stefan and Karl!
